TITLE: The Cooling of the Exhaust-Fan Shaft
(Okhlazhdeniye vala dymososa)

PERIODICAL: Energetik, 1958, Nr 2, p 12-13 (USSR)

ABSTRACT: After criticizing other systems of cooling the exhaust-fan shafts, the author proposes a system of letting water circulate thru a muff surrounding the shaft between the exhaust fan and the bearing. He does not advise this in the case of the console layout of the working wheel on the shaft, because of the danger of vibrations. He describes and illustrates how his system is to be set up on a mobile power station. Tests showed that this system eliminates overheating of the shaft. The tempe-

"Wskazniki wydajności rusztu łaśmowego". Przegląd Górnictwy, No. 3, 1955, Biul. GIG, pp. 8-11, 5 figs.

The problem of efficiency of revolving grates may be reduced simply to the definition of combustion time. With overhead ignition, the capacity of a grate depends on the rapidity with which the flame spreads and on the air supply to the burning layer. The capacity of a grate by weight is determined and is accepted as indicative of the utility of coal for burning in revolving grates and of the maximum grate capacity. Investigations over the influence of the blow on the grate capacity in relation to the ash and moisture content of the coal are also discussed. The results were obtained in an experimental apparatus and refer to coal slack of 0 — 18 mm and 1 — 18 mm. As the level of surface moisture rises, the by-weight gasification capacity drops and the combustibility increases, i.e. the efficiency by weight of the grate increases. From the intersection point of the two lines representing respectively these movements, the intensity of the blow giving the highest grate capacity for a given coal may be obtained.

TITLE: Continuous production of glass reinforced plastic tubes

CITED SOURCE: Sb. Oborud. dlya pererabotki polimerov. Kiyev, Tekhnika, 1964, 163-
180

TOPIC TAGS: plastic, continuous process, fiberglass

TRANSLATION: Results from an investigation of winding and saturating of fiberglass
fillers and of the tube hardening process are presented. The investigation was
conducted in the UkrNIIplastmash and NIIPM. The experimental apparatus consisted of
the following main parts: a mandrel, a switch for turning on the electric energy
which heats the mandrel, coils with a mechanism for placing longitudinally the
separating layers and the previously saturated glass ribbons, a face plate with
eight coils for spiral winding, containers with convective infrared heating ele-
ments, and a pulling mechanism. The continuous production is conducted in the
following manner. Cellophane ribbons, which serve as the separating layer, are fed
Card 1/2

L 61718-65

ACCESSION NR: AR5017133

longitudinally by two coils onto the mandrel. This layer is covered by saturated glass ribbons, also fed longitudinally by two coils. The latter layer is then covered spirally with other glass ribbons. The pipe is pulled by the pulling mechanism consecutively through the infrared and the convective chambers, in which it is hardened. The finished tube is cut into segments of necessary lengths. Compounds were based on polyestermaleins, polyesteracrylates, and epoxy polyester resins. The investigation led to the determination of the following: 1) the optimum parameters for calculating and designing experimental and industrial specimens; 2) the hermetic sealing property of glass-reinforced plastic tubes (produced by laying longitudinal and spirally wound glass ribbons, used in transporting liquids and gases) is assured by the use of binders with elongation of 5-6%, and of fiberglass materials with elongation of 2.5%. Satisfactory sealing is shown by tubes based on polyesteracrylate binders modified with rubber and wound glass ribbon; 3) the hermetic property of tubes increases when the tubes are strengthened with spiral winding of thermoplastic films. Modification of polyesteracrylate with synthetic rubber improves the adhesion between the binding and the sealing polychromevinyl films. 7 illustrations; 7 tables. N. Milemina

TITLE: The Development Methods for Calculating Turbine Parts Under the Conditions
of Creeping

PERIODICAL: Inform. pis'mo Nr 119, Tsentr. n.-i. kotloturbinnyy in-t. Moscow-Lenin-
grad, Mashgiz, 1953, pp 1-5

ABSTRACT: A short exposition of the development results of calculation methods for
the creeping of non-uniformly heated turbine disks of an arbitrary profile
and turbine diaphragms is given. The calculation of the unsteady creeping
of a turbine disk is based on the variation method proposed by L.M. Kacha-
nov. The distribution of stresses in the state of stationary creeping,
necessary for this method, is determined by means of the numerical integra-
tion of the system of two equations with respect to two functions, through
which the stresses and the deformations in the disk are expressed. To satis-
fy the boundary conditions it is necessary to integrate the system 2 - 3
times. The calculation is based on the equations of the fluid dynamics.
The steady creeping of a turbine diaphragm is schematically considered as
a semi-ring of constant thickness, at an arbitrary relation between the ✓

Card 1/2

The Development Methods for Calculating Turbine Parts Under the Conditions of Creeping
creeping rate and the stress. For the determination of the maximum deflection of the dia-
phragm a very simple method by means of two given graphics is proposed. The effect of the
vane deformation can be taken into account, but the calculation appears very difficult.

Polarisatsionno-opticheskiy metod issledovaniya napryatosti: trudy konferentsii
13-21 fevralya 1988 goda [Optical Polarization Method for Stress Analysis:
Transactions of the Conference of February 13-21, 1988]. [Leningrad] Izd-vo
Leningradskogo univ., 1988. 421 p. Karta s il'yu vnesena. 2,000 copies printed.

Karp, M.; S.P. Shishkovets; Tech. Ed.; S.D. Tsvetkov
Editorial Board: S.O. Ovtcharov, L.M. Kostinov, T.M. Kozhevnikov,
N.I. Pridernovyy, V.M. Proshkin, N.S. Korovin, and Yu.K. Molchanov.

PURPOSE: This collection of 93 articles is intended for scientists and engineers
concerned with experimental stress analysis of machine parts and structural
components.

CONTENTS: The collection contains reports presented at the conference on optical
polarization methods in stress analysis held February 13 - 21, 1988, in
Leningrad and attended by 300 delegates including representatives of the People's
Republic of China, the Polish People's Republic, the German Democratic Republic,
and the Republic of Czechoslovakia. The reports discuss general theoretical
problems and new methods of investigation and structure properties and materials
used in the optical method. Solutions of specific two-dimensional and three-
dimensional problems occur in shipbuilding, aircraft design, engine con-
struction, in various branches of heavy and precision machine design, in mining,
mining, hydraulic structures, railroad transport, in structural mechanics,
geodynamics, in the control of stresses in products of the glass and electronic
industry, etc., are given. Solution of the three-dimensional problem by means
of the method of photoelasticity is informed and the use of liquid crystal for
the solution of problems associated with plasticity, creep, dynamics, hysteresis,
dynamics, etc., is demonstrated. Reports previously published elsewhere are
printed here in abbreviated form. No personalities are mentioned. References
are found at the end of 47 of the reports.

AUTHORS: Radtsig, V. A.; Butyagin, P. Yu.

TITLE: EPR spectra of free radicals in the decomposition products of solid oxygen-containing heterochain polymers

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 5, 1965, 922-927

TOPIC TAGS: EPR spectrum, polymer, decomposition mechanism, free radicals

ABSTRACT: This paper is an extension of a previously published work by P. Yu. Butyagin (Dokl. AN SSSR, 140, 145, 1961) on the effect of free radicals formed during the mechanical degradation in oxygen-containing polymers on synthetic organic polymers. EPR spectra of the following polymers were determined: poly-formaldehyde (A), polyethyleneoxide (B), polypropyleneoxide (C). They were then compared with the data for polyvinylalcohol (D). The experimental procedure was that of P. Yu. Butyagin, I. V. Kolbanev, and V. A. Radtsig (Fizika tverdogo tela, 5, 2257, 1963). From the nature of the EPR spectra it is concluded that the mechanical degradation of (A) type chains follows a free radical mechanism, i.e., rupture of O-O-C-O chains, whereas that of polyethyleneoxide chains by the rupture

Card 1/2

L 63039-65

of the C-C bonds. The free radicals formed in the rupture of both types of chains have been detected in the degradation products of macromolecules, B and D, dispersed in an inert medium. The authors thank L. A. Kermilova, K. S. Kazanskiy, and E. D. Oleynik for the polymer specimens used and for their interest in the present work. Orig. art. has: 1 table and 1 graph.

ABSTRACT: For neutralization of comparatively small quantities of spent pickling liquors (about 500 t/year) the use of solid lime or a lime dough is proposed. Laboratory and industrial experiments in which the neutralization with lime dough (lime powder plus some water) in a cement mixer was carried out, indicated that a solid mass (moisture content 60-65%) can be obtained which can be either disposed of or used with appropriate filling materials (asbestos, ground dry peat, straw, etc.) for the manufacture of heat-insulating materials. There are 1 table and 1 figure.

AUTHOR: Radtsig, Yu. A.

TITLE: The Calculation of Statically Indeterminate Trusses for Temporary Load

PERIODICAL: Tr. Kazansk. aviat. in-ta, 1956, Vol. 32, pp. 3-43.

TEXT: The author proposes the representation

$$y(x) = \frac{\beta_1 |x - a_1|}{\beta_2 |x - a_2|} + \frac{\beta_3 |x - a_3|}{\beta_4 |x - a_4|} + \dots + \frac{\beta_m |x - a_m|}{\beta_{m+1} |x - a_{m+1}|}$$

which indicates that either the expression written above the double line or the expression under it may be taken for every term of the sum. The greater expression of these must be chosen, and the argument x must be assigned the value, for which y will be minimized. These functions, named linear mirror out-functions, are used in the article for calculating a statically indeterminate truss for various loads on the basis of the inverse problem providing for the minimum weight. This problem means that the areas of the cross sections of the

The Calculation of Statically Indeterminate Trusses for Temporary Load

truss beams are not assigned beforehand, but, on the contrary, the calculation of their strongly necessary values is the ultimate purpose of the calculation. At the beginning, the singly statically indeterminate truss is calculated, with a condition of the minimum weight, for two different loads under the assumption that it is stressed equally. The greater in absolute magnitude stress of the two stresses in the beam, which correspond to two loads, must be introduced for every beam and for the two loads the same value of the admissible tension is assumed. An approximate calculation procedure for the singly statically indeterminate truss for two loads is recommended on the basis of the "equalization method" developed by the author and the condition that the same occurs in the redundant beam for either load. Linear equations, which determine the optimum distribution of stresses in the singly statically indeterminate truss at definite loads, are applied individually to every load. The author proposes the application of the correspondingly complicated mirror out-function and the equalization method to calculating the singly statically indeterminate truss for many various loads with provision for minimum weight. An analogous procedure is extended to multiply statically indeterminate trusses.

TITLE: The design of practical methods for calculating statically indeterminate beams of minimum volume

SOURCE: Kazan. Aviatsionnyy institut. Trudy, no. 77, 1963. Stroitel'naya mekhanika, 89-108

TOPIC TAGS: fuselage, metal toughness, cylindrical shell, shell stability, metal deformation

ABSTRACT: The author starts by introducing the basic principles underlying the design of practical methods for calculating statically indeterminate beams of minimum volume. These basic principles are the condition of minimum volume and the condition of deformation connectivity. The author then discusses the design of a statically indeterminate beam of minimum volume with a constant height of the cross section. He introduces a practical example of calculating only one half of the beam. An approximate solution of the problem for a beam with a constant height is then carried out. The article concludes with an investigation of an approximate design of a rectangular, statically indeterminate, beam with a

TITLE: Synthesizing a nonuniform line for broadband matching [Report at the
15 Nov 1961 Session of the Antennas Section of the Scientific and Technical
Society of Radio Engineering and Electrocommunication, Moscow]

SOURCE: Radiotekhnika, no. 5, 1963, 29-37

TOPIC TAGS: SHF matching, SHF nonuniform transmission lines, entire functions in
radiophysics

ABSTRACT: The theoretical problem of broadband matching of loads and transmission
lines at superhigh frequencies is considered. The synthesis problem can be solved
by the Stieltjes integral equation; it is completely solvable if the specified
reflection-factor function is represented by a finite-order entire function limited
on the real axis. The length of the nonuniform line can be determined by the
growth of the reflection-factor entire function toward the imaginary axis; hence,
the minimum applicable length is found. The law of distribution of characteristic
impedance over a stepped line is found on the basis of the theory of entire

TOPIC TAGS: transmission line, inhomogeneous transmission line, load matching, complex load matching, reflection coefficient, transmission line synthesis, antenna synthesis

TRANSLATION: The problem of synthesis of an inhomogeneous transmission line to satisfy specified frequency characteristics and to match two complex loads or to match a specified complex load to the wave impedance of a transmission line is solved. The synthesis of

Card 1/2

ACCESSION NR: AR4023762

the inhomogeneous line reduces to determining the line parameters for a load reflection coefficient that is specified within a frequency band. The smallest length of the line which permits solution of the general synthesis problem is determined. The procedure of synthesizing a linear antenna from a known directivity pattern is employed. The smallest length of the inhomogeneous line is determined by the amount by which entire function of finite degree, bounded on the real axis, increases in the direction of the imaginary axis. TITLE: On the synthesis of a sectionalized inhomogeneous line

SOURCE: Kazan. Aviatsionnyy institut. Trudy, no. 73, 1963. Radiotekhnika i elektronika (Radio engineering and electronics), 163-167

TOPIC TAGS: transmission line, matching transformer

ABSTRACT: The article deals with the synthesis of a stepped inhomogeneous line which matches a specified complex load to the wave resistance of a transmission line within a given frequency band. It is required to determine the number of sections and the values of the wave resistance of each of the sections. It is assumed that the lengths of all sections are equal and that the length of the entire section lying in an inhomogeneous line is not shorter than a certain limit which can be readily determined by a procedure developed in another paper by the author (printed in the same collection). The problem is solved in first approximation under the assumption that only a TEM wave propagates in the line and

Card 1/2

L 26965-65
ACCESSION NR: AT5003923

3

the phase propagation constant remains the same over the length of the line, and that all the reflection coefficients are small. The calculation is based on expressing the reflection coefficient in bilinear form and evaluating the coefficients of the bilinear transformation by a method developed by V. I. Popovkin (Synthesis of Antennas and Broadband Antenna Transformers, paper delivered at All-Union Scientific Session of NTORIE im. A. S. Popova, Trudrezervizdat, 1958).
